

Digital Electronics- 2CS303

UNIT-1

Binary Codes

Dr. Sudeep Tanwar, Dr. Pimal Khanpara, Prof. Preksha Pareek

Binary Codes

1. Weighted Codes (8421, 5421)
2. Non Weighted codes (Excess-3 , BCD, Gray/Reflected codes)
3. Error Detection Codes (PARITY Bits, Hamming Codes)
4. Alphanumeric Codes (ASCII, EBCDIC)

Codes

- The **problem** found with computer is how to represent numerals, alphabets, and special characters
- Since data is in the binary form, it must be **converted to a more readable** form known as **Coded form**

1: Weighted Codes:

Weighted binary codes are those binary codes which obey the positional weight principle. Each position of the number represents a specific weight.

Decimal Nos in Weighted Codes:

Decimal.	8421	7421	5421	* 5211	* 4221	* 3321	* 2421	* 842̄1	* 742̄1
0	0000	0000	0000	0000	0000	0000	0000	0000	0000
1	0001	0001	0001	0001	0001	0001	0001	0001	0001
2	0010	0010	0010	0100	0010	0010	0010	0111	0111
3	0011	0011	0011	0101	0011	0100	0011	0101	0101
4	0100	0100	0100	0111	1000	0101	0100	0100	0100
5	0101	0101	1000	1000	1001	0110	0101	1011	1010
6	0110	0110	1001	1010	1010	1100	0110	1010	1001
7	0111	1000	1010	1100	1011	1101	0111	1001	1000
8	1000	1001	1011	1110	1110	1110	0110	1000	1111
9	1001	1010	1100	1111	1111	1111	1111	1111	1110

2: Non-Weighted Codes:

They do **not have a fixed weight** assigned to each symbol position in the code word. For example, ASCII, BCD, Excess-3, and Gray code.

2.1: Excess-3 is a non-weighted coding method. With excess-3, we add 3 to a decimal number before converting it to binary.

Example:

$$(0001)_2 = (0100)_{\text{Excess-3}}$$

$$(0010)_2 = (0101)_{\text{Excess-3}}$$

2.2: BCD (Binary Coded Decimals) is a non-weighted coding method. Individual decimal digits are converted into equivalent binary bits.

Example:

$$(321)_{10} = (0011 \ 0010 \ 0000)_{\text{BCD}}$$

$$(000)_{10} = (0000 \ 0000 \ 0000)_{\text{BCD}}$$

$$(80)_{10} = (1000 \ 0000)_{\text{BCD}}$$

$$(00)_{10} = (0000 \ 0000)_{\text{BCD}}$$

$$(10)_{10} = (0001 \ 0000)_{\text{BCD}}$$

$$(11)_{10} = (0001 \ 0001)_{\text{BCD}}$$

BCD

Decimal.	8421 BCD.
0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001
10	0001 0000
11	0001 0001
12	0001 0010
13	0001 0011
14	0001 0100
15	0001 0101

2: Non-Weighted Codes:

2.3: Gray Codes: It is also called as Reflected Binary codes. It is generated via getting mirror image of given data. Only 1 bit will change each time when the decimal number is incremented. Whereas the binary system requires all four bits to change when going from 7 to 8

Example : 4 bit Gray codes.

Decimal	0	1	2	3	4	5	6	7	8	9	10	11	12
Gray	0000	0001	0011	0010	0110	0111	0101	0100	1100	1101	1111	1110	1010

Decimal	13	14	15
Gray	1011	1001	1000

0	0	0	0
0	0	0	1
0	0	1	1
0	0	1	0
0	1	1	0
0	1	1	1
0	1	0	1
0	1	0	0
1	1	0	0
1	1	0	1
1	1	1	1
1	1	1	0
1	0	1	0
1	0	1	1
1	0	0	1
1	0	0	0

2: Code Conversion:

Converting Binary Codes to Gray codes

Method:

1. Copy MSB of Binary code to MSB of Gray code. **(As it is)**
2. Add MSB of Binary with Next MSB of Binary to get next Gray code.
3. Discard the carry
4. Repeat the same process till we get the LSB

Example: Convert $(0001)_2$ into Gray code.

Decimal.	Binary.	Gray.
0	0000	0000
1	0001	0001
2	0010	0011
3	0011	0010
4	0100	0110
5	0101	0111
6	0110	0101
7	0111	0100
8	1000	1100
9	1001	1101
10	1010	1111
11	1011	1010
12	1100	1010
13	1101	1011
14	1110	1001
15	1111	1000

2: Code Conversion:

Converting Binary Codes to Gray codes

Method:

1. Copy MSB of Binary code to MSB of Gray code.
2. Add MSB of Binary with Next MSB of Binary to get next Gray code.
3. Discard the carry
4. Repeat the same process till we get the LSB

Example: Convert $(1011)_2$ into Gray code.

Decimal.	Binary.	Gray.
0	0000	0000
1	0001	0001
2	0010	0011
3	0011	0010
4	0100	0110
5	0101	0111
6	0110	0101
7	0111	0100
8	1000	1100
9	1001	1101
10	1010	1111
11	1011	1010
12	1100	1010
13	1101	1011
14	1110	1001
15	1111	1000

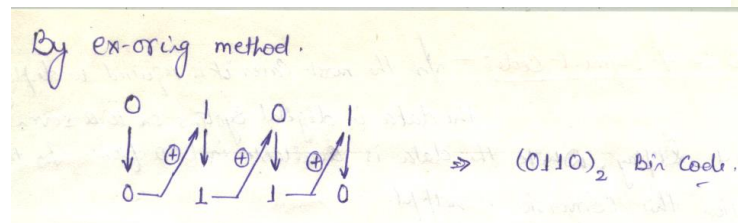

2: Code Conversion:

Converting Gray Codes to Binary codes

Method:

1. Copy MSB of Gray code to MSB of Binary code. **(As it is)**
2. If next bit of Gray code is “1”, then invert the present binary bit as next bit.
3. If next bit of Gray code is “0” then copy the present binary bit as next bit.

Example: Convert (1011) gray into Binary code.

Decimal	Gray	Binary
0	0000	0000
1	0001	0001
2	0011	0010
3	0010	0011
4	0110	0100
5	0111	0101
6	0101	0110
7	0100	0111
8	1100	1000
9	1101	1001
10	1111	1010
11	1110	1011
12	1010	1100
13	1011	1101
14	1001	1110
15	1000	1111

Binary to BCD and BCD to Binary:

1st Binary to BCD:-			2nd BCD to Binary:-		
Decimal	Bin.	BCD	Decimal	BCD	Binary
0	0000	0000	0	0000	0000
1	0001	0001	1	0001	0001
2	0010	0010	2	0010	0010
3	0011	0011	3	0011	0011
4	0100	0100	4	0100	0100
5	0101	0101	5	0101	0101
6	0110	0110	6	0110	0110
7	0111	0111	7	0111	0111
8	1000	1000	8	1000	1000
9	1001	1001	9	1001	1001
10	1010	0001 0000	10	0001 0000	1010
11	1011	0001 0001	11	0001 0001	1011
12	1100	0001 0010	12	0001 0010	1100
13	1101	0001 0011	13	0001 0011	1101
14	1110	0001 0100	14	0001 0100	1110
15	1111	0001 0101	15	0001 0101	1111

BCD to Excess-3 and Excess-3 to BCD:

3rd BCD to Excess-3:-

Decimal	BCD	Excess-3
0	0000	0011
1	0001	0100
2	0010	0101
3	0011	0110
4	0100	0111
5	0101	1000
6	0110	1001
7	0111	1010
8	1000	1011
9	1001	1100

4th Excess-3 to BCD:-

Decimal	Excess-3	BCD
0	0011	0000
1	0100	0001
2	0101	0010
3	0110	0011
4	0111	0100
5	1000	0101
6	1001	0110
7	1010	0111
8	1011	1000
9	1100	1001

Binary to Excess-3 and Excess-3 to Binary:

5. Binary to Excess-3:-

Decimal	Bin.	Excess-3.
0	0000	0011
1	0001	0100
2	0010	0101
3	0011	0110
4	0100	0111
5	0101	1000
6	0110	1001
7	0111	1010
8	1000	1011
9	1001	1100
10	1010	1101
11	1011	1110
12	1100	1111

6. Excess-3 to Binary:-

44

Decimal	Excess-3	Bin.
0	0011	0000
1	0100	0001
2	0101	0010
3	0110	0011
4	0111	0100
5	1000	0101
6	1001	0110
7	1010	0111
8	1011	1000
9	1100	1001
10	1101	1010
11	1110	1011
12	1111	1100

BCD Arithmetic:

Example 1: (83) +(11) =(94)

83	1 0 0 0	0 0 1 1
11	1 0 0 1	1 0 0 1

1 0 0 1 0 1 0 0 = (94)

Example 2: (83) +(18) =(101)

83	1 0 0 0	0 0 1 1
11	0 0 0 1	1 0 0 0

1 0 1 0 **1** 1 0 1 1

0 1 1 0

1 0 0 0 0 1
